Screenfetch en Linux & macOS

By mar10

ScreenFetch es una herramienta de información del sistema diseñado principalmente para Bash Shell, pero funcionan con otros tipos de shell también. La herramienta puede detectar automáticamente la **distribución de Linux** que esté utilizando y generar el **logo ASCII** de la distribución con cierta información valiosa a la derecha del logo. La herramienta se puede personalizar para cambiar los colores, ajustar no ASCII y tomar capturas de pantalla después de mostrar la información.
